### **PHARMACOLOGICAL STUDY OF THE COMPOUNDS OF THE INVENTION**

#### **EXAMPLE 12 : *In vitro* activity**

##### ✧ L1210 murine leukaemia

L1210 murine leukaemia was used *in vitro*. The cells are cultured in RPMI 1640 complete culture medium containing 10 % foetal calf serum, 2mM glutamine, 50 units/ml of penicillin, 50 µg/ml of streptomycin and 10mM Hepes, pH = 7.4. The cells are distributed on microplates and are exposed to the cytotoxic compounds for 4 doubling periods, or 48 hours. The number of viable cells is then quantified by a colorimetric assay, the Microculture Tetrazolium Assay (J. Carmichael *et al.*, Cancer Res.; 47, 939-942 (1987)). The results are expressed as the IC<sub>50</sub>, the concentration of cytotoxic agent that inhibits the proliferation of the treated cells by 50 %. All the compounds of the invention exhibit good cytotoxicity with respect to this cell line. By way of example, the compound of Example 2 has an IC<sub>50</sub> of 0.25µM with respect to L1210.

##### 5      ✧ Human cell lines

The compounds of the invention were also tested on human cell lines originating from solid tumours, in accordance with the same test protocol as that described for L1210 murine leukaemia but with incubation periods of 4 days instead of 2 days. By way of illustration, the compound of Example 2 has an IC<sub>50</sub> of 0.27µM with respect to DU145 prostate carcinoma, 0.16µM with respect to A549 non-small-cell lung carcinoma, 0.6µM with respect to HT-29 colon carcinoma and 0.26µM with respect to KB-3-1 epidermoid carcinoma.

10      Those different results clearly demonstrate the strong anti-tumour potential of the compounds of the invention with respect to leukaemias and solid tumours.

**EXAMPLE 13 : Action on the cell cycle**

L1210 cells are incubated for 21 hours at 37°C in the presence of various concentrations of test compounds. The cells are then fixed by 70 % (v/v) ethanol, washed twice in PBS and incubated for 30 minutes at 20°C in PBS that contains 100 µg/ml of RNase and 50 µg/ml of propidium iodide. The results are expressed in terms of the percentage of cells that have accumulated in the G2+M phase after 21 hours, compared with the control (control: 20 %). The compounds of the invention are of special interest; at a concentration of less than 2.5µM, they induce accumulation of at least 80 % of cells in the G2+M phase after 21 hours.

**EXAMPLE 14 : *In vivo* activity*****Anti-tumour activity on P 388 leukaemia***

Line P388 (murine leukaemia) was supplied by the National Cancer Institute (Frederick, USA). The tumour cells (10<sup>6</sup> cells) were inoculated on day 0 into the peritoneal cavity of female B6D2F1 mice (Iffa Credo, France). Six mice weighing from 18 to 20 g were used per test group. The products were administered by the intraperitoneal route on day 1.

The anti-tumour activity is expressed as % T/C :

$$\% \text{ T/C (mouse)} = \frac{\text{Median survival time of the treated animals}}{\text{Median survival time of the control animals}} \times 100$$

- 5 The results obtained show excellent *in vivo* activity in the P 388 leukaemia model, with a T/C of 210 % for a dose of 50 mg/kg, along with low toxicity of the compounds, indicating an excellent therapeutic index.
